IMPACT OF THE SOURCE TEXT FEATURES UPON TRANSLATION STRATEGIES

Iryna Lypko (Kharkiv, Ukraine)

This paper deals with the application of calquing and transformation as global approaches to the task of the English source text rendering into Ukrainian by students majoring in International Relations. Within this paper calquing is viewed in a limited interpretation as compared to the definitions given by various authors (see, for example, [1-4]). Here it means copying the structure of the source language sentence in the target text using the means of the target language, for example: 'The UN was founded on 24 October 1945' - 'OOH було засновано 24 жовтня 1945 року'). Calquing overuse results in a machine-like translation when the target text abounds in unnatural sentence structures borrowed from the source language. However calquing in general may be acceptable in some cases and its efficiency as a translation strategy requires a special research.

Transformation within this paper is regarded as a strategy somewhat opposite to calquing in the sense that it is related to the changes of the structure of the source language sentence in the target text. Those changes may involve a wide range of techniques, such as permutation [1] (transposition [4]), deletion [1] (linguistic compression [4]), addition [1] (linguistic amplification [4]) and others.

Basing upon the assumption that the adequacy of the target text generated by calquing, may depend upon the degree of the particular source text fragment's structure coincidence with the corresponding target text structures, we had formulated a research hypothesis. It ran: The correlation of calquing and transformation depends on the degree of coincidence between the source text's (or its fragment's) structure with the corresponding target language structures – the share of calquing shall increase as the degree of the said coincidence increases, and the share of transformations shall increase as the degree of the said coincidence decreases.

The validity of the hypothesis was checked within a framework of a special research. The subjects (seven third-year undergraduates majoring in International Relations at Yaroslav Mudryi National Law University (Kharkiv, Ukraine), three males and four females, 19–20 years old) were offered to translate into English a Ukrainian-language text consisting of 13 sentences (1752 characters) from the Dzerkalo Tyzhnia (Mirror of the Week) newspaper. The text highlighted the ASE-AN annual summit. The use of any reference materials was not allowed.

The conducted research allows to assume that the choice of the strategy may depend, among other factors, on the structure of the matching source text structure. If its principles coincide with the corresponding target language principles, it is favourable for the calquing strategy application, which may be justified in this case. Clauses with the direct order of words proved to be the most favourable ones for calquing while transformation was the easiest apply while translating clauses with evident deviation from the target language norms

When the sentence structure is abundant in subordinate and coordinate clauses with a considerable amount of words that hinder a clear perception of the general message, it may aggravate the prospects for the transformation use.

The said conclusions have to be checked on a wider population of subjects, which may be regarded as the prospect for the further research.
